

EPA-600/S7-81-012c Sept. 1981

Project Summary

EPA Utility FGD Survey January – March 1981

M. Smith, M. Melia, N. Gregory, and K. Scalf

This report, generated by a computerized data base system, presents a survey of operational and planned domestic utility flue gas desulfurization (FGD) systems, operational domestic particle scrubbers, and Japanese coalfired utility boiler FGD installations. It summarizes information contributed by the utility industry, system and equipment suppliers, system designers, research organizations, and regulatory agencies. It presents data on system design, fuel characteristics, operating history, and actual performance. Unit by unit dependability parameters are included. Problems and solutions associated with the boilers, scrubbers, and FGD systems are discussed.

The domestic FGD systems are tabulated alphabetically by development status (operational, under construction, or in the planning stages), utility company, system supplier, process, waste disposal practice, and regulatory class. FGD system economic data, definitions, and a glossary of terms are appended to the report. Current data for domestic FGD systems show 87 systems in operation, 35 systems under construction, and 104 planned systems. Projected 1990 FGD controlled capacity in the U.S. is 108,612 MW.

This Project Summary was developed by EPA's Industrial Environmental Research Laboratory, Research Triangle Park, NC, to announce key findings of the research project that is fully documented in a separate report

of the same title (see Project Report ordering information at back).

Introduction

This report is prepared quarterly (every 3 months) by PEDCo Environmental, Inc., under contract to the Industrial Environmental Research Laboratory/Research Triangle Park and the Stationary Source Enforcement Division of the U.S. Environmental Protection Agency. It is generated by a computerized data base system, the structure of which is illustrated in Figure 1 (see pages 6 and 7).

Table 1 summarizes the status of FGD systems in the United States at the end of March 1981. Table 2 lists the units that have changed status during the first quarter 1981, and Table 3 shows the performance of operating units during this period.

Current projections indicate that the total power generating capacity of the U.S. electric utility industry will be approximately 833 GW by the end of 1990.1 (This value reflects the annual loss resulting from the retirement of older units, which is considered to be 0.4% of the average generating capacity at the end of each year.2) Approximately 370 GW or 44% of the 1990 total will come from coal-fired units. The distribution of power generation sources, both present (December 1979) and future (December 1990) is shown in Table 4.1

Based on the known commitments to FGD by utilities as presented in Table 1, the percentage of electrical generating

capacity controlled by FGD for both the present (March 1981) and the future (December 1990) is shown in Table 5.

In light of the revised New Source Performance Standards, actual FGD control is expected to be greater than what is reflected by the figures above. For example, about 40 to 50 systems 25,000 MW of generating capacity presently fall into the uncommitted category. These are systems that cannot be included in the committed group at this time because information regarding their status is not ready for public release.

Table 1. Number and Total Capacity of FGD Systems

Status	No. of units	Total controlled capacity, MW*	Equivalent scrubbed capacity, MW†
Operational	87	32,717	29,538
Under construction	<i>35</i>	14,835	14,481
Plánned:			
Contract awarded	27	13,796	13,796
Letter of intent	11	8,235	8,235
Requesting/evaluating bids	18	10,191	10,075
Considering only FGD systems	48	28,838	28,850
Total	226	108,612	104,975

^{*}The summation of the gross unit capacities (MW) brought into compliance with FGD systems regardless of the percent of the flue gas scrubbed by the FGD systems. †The summation of the effective scrubbed flue gas in equivalent MW based on the percent of flue gas scrubbed by the FGD systems.

representing approximately 20,000 to

In an effort to show general F usage and projected usage trends. Ta 6 gives a current (March 1981) an projected (December 1990) breakdo of throwaway product systems vers salable product systems as a percenthe total known commitments to FGD of the end of the first quarter 1981.

Highlights: January - March 1981

The following paragraphs highli-FGD system developments during first quarter of 1981.

Arizona Public Service announce that initial FGD operations at Cholli commenced in March 1981. The 3 MW (gross) boiler fires pulverized c with an average sulfur content of 0.5 Flue gas flows through an ESP to double-loop, spray-packed tower (f search-Cottrell design) which uses limestone slurry and treats 36% of t flue gas. The system operated 1 we and was shut down for a beari inspection.

Basin Electric Power Coop announce that a contract was awarded to -

uvalent scrubbed capacity

wiability, operability, reliability, and utilization as defined in Appendix C of the full report

nufacturing/Niro Atomizer for a e/spray drying FGD system to be talled at Antelope Valley 2. The 440 V (gross) unit will fire lignite with an rage sulfur content of 0.68%. Operans are scheduled to commence in ober 1985.

The limestone FGD system operated Laramie River 1 of Basin Electric wer achieved 100% availability for first quarter of 1981. The system trated for the 3 month period with no jor problems reported.

he dual-alkali scrubbing system talled at Newton 1 of Central Illinois Dic Service achieved availabilities of %, 100%, and 90% during January, pruary, and March, respectively. No jor FGD-related problems were corted during the three months.

nitial operation of the FGD system at st Bend 2 of Cincinnati Gas and actric commenced in March 1981. e unit fires pulverized coal with an irage sulfur content of 3.0%. A hote ESP is followed by three lime FGD odules, supplied by Babcock and lcox. The stabilized sludge from this used water loop system is disposed of an on-site landfill. The system erated in a shakedown/debugging ase during March.

Colorado Ute Electric announced that nstruction of the Craig 3 FGD system gan during the first quarter of 1981. In the lime/spray-drying system is being pplied by Babcock and Wilcox. The i5-MW (gross) unit will fire pulverized abbituminous coal with an average alfur content of 0.45%. A fabric filter ill be used to collect the flyash and the y calcium sulfite/sulfate particulate atter (as well as any unused reagent).

Table 4. Power Generation Sources; Present and Future

	Coal	Nuclear	Oil	Hydro	Gas	Other	GW (total)
December 1979		- / -	25%	. 0,0	13%	1%	603
December 1990	44%	14%	20%	11%	10%	1%	833

Startup of the FGD system is expected in April 1983.

Columbus and Southern Ohio Electric reported that the Conesville 5 FGD system achieved availabilities of 91% and 94% for January and February, respectively. The Conesville 6 FGD system achieved availabilities of 98% and 92% for the same period, respectively. No major FGD-related problems were reported for either system during the 2 months. March performance data were not provided.

The 20-MW prototype dual-alkali/limestone test program being conducted by Thyssen/CEA and Arthur D. Little at the Scholz station of Gulf Power was completed on March 28. The program was conducted to determine the feasibility of using limestone rather than lime as the source of calcium for regeneration reactions. The system reportedly achieved SO₂ removal efficiencies of 96% and 97% during February and March, respectively.

There are no current plans to continue operation of the prototype.

The Elrama FGD system of Duquesne Light achieved availabilities of 100% for January and 97% for February. With the exception of some absorber module lining repairs during February, no major operational problems were encountered during the 2 months. Information for March was not provided.

lowa Electric Light and Power announced that a letter of intent was signed with Combustion Engineering for the installation of a wet limestone scrubbing system on Guthrie County 1. The unit is rated at 720 MW (gross) and will fire pulverized subbituminous coal with an average sulfur content of 0.4%. An ESP will provide primary particulate matter control. Operations are scheduled to commence in October 1984.

Jacksonville Electric Authority announced that bids are being requested for wet limestone FGD systems to be installed at Units 1 and 2 at the St.

Table 5. FGD Controlled Generating Capacity; Present and Future

	Coal-fired generating capacity controlled by FGD, %	Total generating capacity controlled by FGD, %
March 1981*	13.9	5.4
December 1990	<i>29.6</i>	13.0

^{*}The number of committed FGD systems is as of March 1981; however, the figure used for the total generating capacity and coal-fired generating capacity is based on the available December 1979 figures.

s category includes the flue gas capacity being handled by the FGD system at least part of the time during the report period

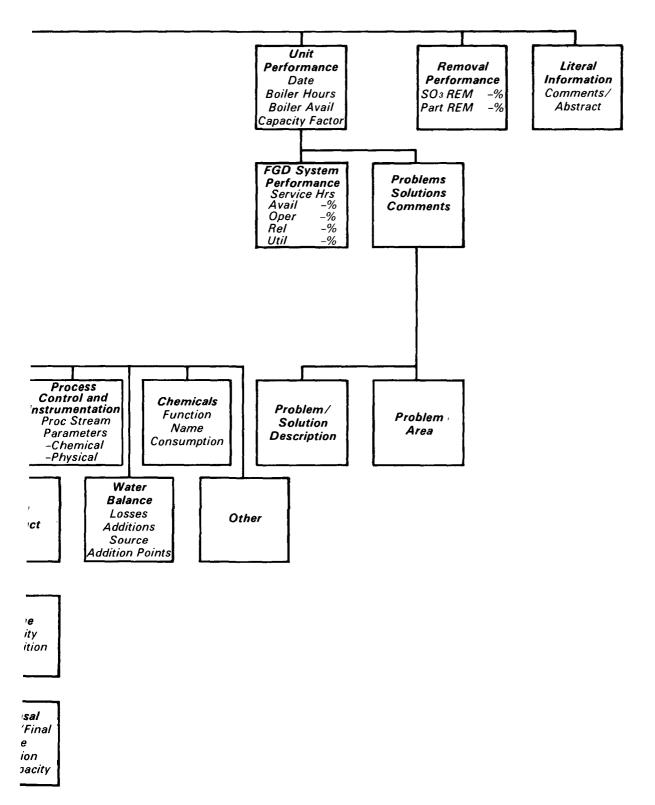

percent figures listed are average values for all system scrubbing trains during the period.

e gas % scrubbed for prototype and demonstration units is not applicable unless the system is designed to bring a unit into compliance with SO₂ emission standard.

Outlet C

Figure 1. Computerized data base structure diagram.

Johns River Power Park. Each 500-MW (gross) unit will fire pulverized coal with an average sulfur content of 2.5%. Initial operations are scheduled for 1985 and 1987, respectively.

Kentucky Utilities announced that bids are being requested for limestone FGD systems at Hancock 1 and 2. The 708-MW (gross) units will be located in Hawesville, Kentucky, and will fire Western Kentucky coal with an average sulfur content of 3.5%. ESP's will be used to control particulate matter emissions. Operations are scheduled to commence in 1988 and 1994, respectively.

The FGD system at Clay Boswell 4 of Minnesota Power and Light achieved 100% availabilities during January, February, and March. No major problems were reported for the lime/alkaline flyash FGD system during the 3 months.

Montana Power reported that the Colstrip 1 FGD system achieved availabilities of 96% and 97% for January and February, respectively. The Colstrip 2 FGD system achieved availabilities of 98 and 97% for the same 2 months, respectively. No major FGD related problems were reported for either system. March performance data were not provided.

The limestone/alkaline flyash FGD systems installed at Sherburne 1 and 2 of Northern States Power achieved 100% availabilities for the first quarter of 1981. No major operational problems were reported for the 3 months.

San Juan 1 of the Public Service of New Mexico achieved availabilities of 100%, 98%, and 100% during January, February, and March, respectively. San Juan 2 achieved availabilities of 97%, and 94% during the same period, respectively. No major FGD-related problems were reported during the three months.

The limestone FGD system installed at Winyah 2 of South Carolina Public Service achieved availabilities of 99%, 97%, and 100% during the months of January, February, and March, respectively. An expansion joint problem in the quencher discharge pump was the only major problem reported during the 3 months.

The FGD system installed at A.B. Brown 1 of Southern Indiana Gas and Electric achieved availabilities of 99%, 99%, and 94% during January, February, and March, respectively. Some minor pump and vacuum filter problems were reported during the 3 months; however,

Table 6. Summary of FGD Systems by Process

		Percent d	of total MW
	_	March 1981	December 1990
Throwaway product prod	cess		
Wet systems			
Lime		39.6	20.2
Limestone		47.4	<i>36.2</i>
Dual alkali		4.1	1.9
Sodium carbonate		3 .1	3 .0
<i>NA</i> ^a		_	6.3
°Dry systems			
Lime		0.4	2.9
Sodium carbonate			0.4
Salable product process			
Process	Byproduct		
Aqueous carbonate/ spray drying	Elemental sulfur	-	0.1
Citrate	Elemental sulfur	0.2	0.1
Lime	Gypsum	_	0.1
Limestone	Gypsum	_	0.2
Lime/limestone	Gypsum	_	0.5
Magnesium oxide	Sulfuric acid	_	0.7
Wellman Lord	Sulfuric acid	2.4	1.2
Wellman Lord	Elemental sulfur	2.8	0.7
Process undecided			25.5
	Total	100.0	100.0

a Not available (these systems are committed to a throwaway product process; however, the actual process is unknown at this time).

overall system unavailable time was minimal.

Tennessee Valley Authority announced that initial FGD operations at Widows Creek 7 commenced in March 1981. The 575-MW (gross) unit fires pulverized coal with an average sulfur content of 3.7%. The limestone spray tower absorber FGD system is preceded by an ESP and four variable-throat venturies for primary particulate matter control. The system operated in a shakedown/debugging mode throughout March.

Utah Power and Light announced that construction of the FGD systems at Hunter 3 and 4 began in March 1981. The 400-MW (gross) units are being constructed in Castledale, Utah, and will fire pulverized bituminous coal with an average sulfur content of 0.55%. GE Environmental Services, Inc. (formerly Chemico) is supplying the limestone FGD systems which are expected to begin initial operations in 1983 and 1985, respectively.

Washington Water Power announced plans to construct Creston Coal 2, 3, and 4 in Creston, Washington. Each 570-MW (gross) unit will use a limestone FGD system for SO₂ control. Construction at this site is scheduled to commence in 1983, with initial operation of the units currently scheduled for 1987.

West Pennsylvania Power announced that construction of the Mitchell 33 FGD system began in March 1981. This 300-MW (gross) unit is being constructed in Courtney, Pennsylvania, and will fire coal with an average sulfur content of 2.8%. The lime scrubbing process is being supplied by GE Environmental Services, Inc., and is designed for a 95% SO₂ removal efficiency. The system is expected to commence operation in August 1982.
